Use Of GEO-SAND In Bunkers.

GEO-SAND is specially designed to provide superior drainage to bunkers on a long-term basis. The highly permeable fiber mesh of GEO-SAND allows rapid removal of rain or irrigation water from the sand while enabling the sand to retain its natural stability. The long-term drainage capability of the product reduces sand erosion even during heavy rains while saving on manpower cost to maintain bunker faces. GEO-SAND allows design of beautiful bunker faces with ease of maintenance while improving the overall aesthetics of the golf course.

Installation Details.

Installation details with regard to the perimeter edges of the bunker will often vary depending on the future intended maintenance practices of the golf course. The key to these considerations is to ensure that the liner will not be damaged or otherwise compromised bunker maintenance practices. The diagram below illustrates GEO-SAND installation with attention to the edges.
